

English Through AI: Lesson 1 – Understanding Artificial Intelligence

Learning the Language by Creating Practical Projects

1. Explain Artificial Intelligence and how Large Language Models work.

2. Master the Present Simple and Present Perfect tenses to discuss AI tools.

3. Choose a practical AI project for your course (e.g., CV writing, emails).

Instructor Dashboard

Pacing Guide

60-minute individual lesson.

Audience Profile

Adult Ukrainian learner, B2 level (Upper-Intermediate). Priority: Speaking fluency & AI literacy.

Format Note

All light panels are student-facing materials. All dark panels are private teacher instructions.

Materials Checklist

Ensure internet access and active tabs for ChatGPT, Gemini, Claude, or Grok.

Warm-Up: Your AI Experience

Which AI tools **have you used** before today? (e.g., ChatGPT, Claude, translation apps)

What **has been** your most successful experience with AI so far?

Have you ever seen an AI make a funny or confusing mistake?

Speaking Task Guidelines (5-7 mins)

Error Correction Focus:

Listen specifically for **Present Perfect vs. Past Simple** confusion (e.g., "I have used ChatGPT yesterday" [insert a red X icon  vs "I used ChatGPT yesterday" ]).

Cultural Context:

Ukrainian adult professionals are often highly tech-literate. Encourage them to talk about specific workplace tasks (IT, logistics, marketing) where they have experimented with AI.

Decoding the "Black Box": What is AI?

What is Artificial Intelligence?

Many people think AI is a thinking brain. In reality, it is a complex mathematical system.

A **Large Language Model (LLM)** is a specific type of AI. An LLM **predicts** the next word in a sentence, much like the autocomplete on your phone, but much more powerful. It **analyzes patterns** and **generates** human-like text. It does not 'understand' words; it calculates probabilities.

The LLM Engine

⚙️ Reading & Concept Check (5 mins)

1. Pacing: Have the student read aloud. Check pronunciation of 'Artificial', 'Probabilities', and 'Generates'.

2. Block 2: Concept Question: Does an LLM actually think about its answer? (Expected answer: No, it predicts words based on used on math).

Prompts, Context, and Pitfalls

To talk to an LLM, you write an input, usually called a **prompt**. The AI also needs **context**—background information to understand your goal.

The AI searches its **training data** to create an output. We always want high **accuracy**, but sometimes the AI invents facts. This is a **hallucination**.

Instruction: Ensure the student understands that a "hallucination" in AI is a technical term for "confident wrongness," not a human psychological state.

Hallucination Flowchart

[!] Note: AI capabilities change rapidly. Always verify current facts.

Vocabulary Matrix: Connect the Concepts

1. Artificial Intelligence

2. Large Language Model

3. Prompt

4. Context

5. Input

6. Output

7. Training Data

8. Accuracy

9. Hallucination

 The text the AI produces

 A false fact the AI invents

 The information the AI learned from

 Your typed instruction

 How correct the answer is

 Data given to the system

 Background situation

 Specific instruction

 Next-word prediction engine

Answer Key (3-5 mins)

1 = Math system imitating logic

2 = Next-word prediction engine

3 = Specific instruction

4 = Background situation

5 = Data given to the system

6 = Data produced by the system

7 = Information the AI learned from

8 = Correctness

9 = Invented false fact

Correction tip:

Ask the student to use 'Prompt' and 'Output' in a single sentence to confirm understanding.

Grammar in Context: Talking About Tech

Present Simple

Used for general facts and routines.

ChatGPT writes emails.
An LLM predicts words.

Present Perfect

Used for experience up to the present moment.

I have written three emails with AI today.
We have tested this prompt.

Mini-Drill

Fill in the blanks: Grok 3 [**have/has**] 100,000 GPUs.
I [**use/have used**] Claude for roleplaying.

⚙️ Grammar Drill & Monitor (5 mins)

Drill:

Have the student create 2 original sentences about AI using Present Simple, and 2 using Present Perfect.

Common B2 Mistake:

Watch for the omission of the auxiliary verb (e.g., 'I written three emails').

Language Toolbox: Opinions & Examples

⚙️ Scaffolding the Speaking Task (3 mins)

Conversation Builder

Instruction:

Do not let the student skip Step 3. B2 learners often state opinions without seamlessly transitioning into examples. Model the flow for them once before moving to the next slide.

The Practical Experiment: Prompt Testing

⚙️ **Lab Setup Guidelines**
(2 mins)

The Test Prompt

Write a 3-sentence email to a colleague named Anna. Ask her for a short meeting tomorrow to discuss the new project timeline. The tone should be polite but casual.

1.

Copy the exact prompt above.

2.

Open two different AI platforms (Choose from: ChatGPT, Gemini, Claude, or Grok).

3.

Input the prompt and generate the output.

Neutrality Check: Allow the student to choose the platforms. Remain strictly neutral about the companies (OpenAI, Google, Anthropic, xAI).

Tech Check: Ensure the student knows how to copy/paste between their Zoom/browser windows.

The Comparison Matrix

Evaluation Criteria	Platform 1 (e.g., ChatGPT)	Platform 2 (e.g., Claude)
Accuracy (Did it follow all instructions? 3 sentences? Right name?)		
Tone (Was it polite but casual?)		
Speed (How fast was the output?)		
Hallucination Check (Did it invent any details, like a specific project name, not in the context?)		

Note: Claims about 'the best' model change rapidly. Always verify current capabilities.

 Live Lab Execution
(10 mins)

Troubleshooting: If platforms require logins the student doesn't have, screen-share and run the prompts for them on your end.

Context Note: Point out that models like Grok 3 (with DeepSearch) or Claude (great for roleplay) have different strengths, but for a simple email, differences will be subtle.

Evaluating the Output

Which platform generated the best output?
Why? (Use: 'I've found that...', 'For instance...')

Did either AI hallucinate or add information
that was not in the prompt's context?

How **have** your thoughts about AI **changed**
after seeing this side-by-side comparison?

⚙️ Speaking & Feedback (10 mins)

Active Listening:

Prompt the student to use the target language. If they say "ChatGPT was good," reply with, "Can you use the phrase **In my experience** and give me a specific accuracy example?"

Model Answer Expectation:

"In my experience, Claude had better accuracy. For instance, it strictly wrote 3 sentences, while Gemini wrote 4."

Deploy: Choose Your Course Project

Project Menu

AI-Assisted CV/Resume

Use AI to translate and polish your professional CV for international roles.

Email Automation Templates

Create 5 reliable English email templates for your specific workplace needs.

Custom Vocabulary Flashcards

Use AI image generators to create localized, personalized flashcards for your industry.

Task: Choose one project. Explain why you have chosen it using Present Perfect and an example.

Needs Analysis (5 mins)

Guidance:

Help the student select a project relevant to the Ukrainian professional market.

If they are seeking remote work, push for Project 1.
If they work in a multinational team, push for Project 2.

Homework: Project Proposal

Assignment Terminal

Write a short paragraph (80-100 words) **proposing your chosen project.**

Requirements Checklist

- ☐ Use at least **4 vocabulary words** from today (e.g., *prompt*, *context*, *accuracy*, *LLM*).
- ☐ Use the **Present Simple** to describe general facts.
- ☐ Use the **Present Perfect** to describe your experience so far.
- ☐ Use one phrase from the **Opinions & Examples** toolbox.

Homework Grading Rubric

Evaluation criteria:

1. Vocabulary usage (Are the tech terms used correctly in context?).
2. Grammar accuracy (No mix-ups between Present Perfect/Simple).
3. Cohesion (Does the opinion phrase flow naturally into the example?).

Teacher's Vault: Complete Answer Keys

Vocabulary Matrix (Slide 5) Answers

- **Artificial Intelligence** = A complex mathematical system imitating human logic.
- **LLM** = A next-word prediction engine.
- **Prompt** = Your typed instruction.
- **Context** = Background information provided to the AI.
- **Input** = Data given to the system.
- **Output** = The text the AI produces.
- **Training Data** = The information the AI learned from.
- **Accuracy** = How correct and factual the answer is.
- **Hallucination** = A false fact the AI invents.

Grammar Drill (Slide 6) Answers

- **Grok 3** has 100,000 GPUs (Present Simple).
- **I have used Claude** (Present Perfect).

Teacher's Vault: Feedback Form Template

Criteria 1: B2 Speaking Fluency	Did the student string together multi-clause sentences? Did they successfully transition from opinions to examples using the toolbox?	Score (1-5): _____
Criteria 2: Vocabulary Retention	Did the student use terms like 'Prompt', 'Output', and 'Hallucination' accurately without defaulting to vague words like 'thing' or 'answer'?	Score (1-5): _____
Criteria 3: AI Literacy	Does the student understand that AI is a predictive text engine, not an infallible human brain?	[Pass / Fail]
Next Steps: Recommendations for Lesson 2 based on this score. _____ _____ _____		

Source Directory & Verification Checklist

Source Filenames Used

- AI in technical writing: complete guide for 2026 - Instrktiv (Workflows, limits)
- Grok 3: Everything you need to know - daily.dev (Model capabilities, specs)
- Turn Claude Into Your Personal Language Tutor - Maverick AI (LLM roleplay/CEFR constraints)
- Little Language Lessons - Google Blog (AI integration in learning)
- Creating Flashcards with AI - HK TESOL (Project applications)

Changeable Claims Checklist (Verify before teaching)

- ☐ **Model Supremacy:** Check current benchmarks; Grok 3, GPT-4o, Claude 3.5, and Gemini rankings change monthly.
- ☐ **Pricing/Access:** Verify if Grok 3 still requires X Premium+ (\$40/mo), or if Claude/Gemini free tiers have shifted.
- ☐ **Feature Availability:** Verify if DeepSearch or specific Voice Modes are currently active in the tested regions.
